

INSIDE

01 — What it is, and why

02 — The seven parts

03 — How a voter is heard

04 — Publishing on a domain

What has been done, what is promised, and what Bauchi still needs.

A public-source record of delivery and commitment across Bauchi State, published as **7 pages that open on any phone** — then a paper brief for the people who need the whole shape of it in one sitting.

REGISTRATION AREAS

A voter asks four questions. Public records answered them in four places.

Is anything actually getting done? What has been promised? What does my own area look like? And who is checking any of this? Bauchi's answer to each lives on a different government page, a different news site, or a PDF nobody opens twice. This joins them.

The gap it fills. Nobody had put a need, a delivery and a promise side by side for Bauchi State. A voter could read a project announcement, or a campaign promise, but not "this is what we still need here, this is what has been done, and this is what is next." The Atlas gives that per local government area, on a tappable map.

"If a line on this site cannot be traced to a numbered source, it does not belong on the site."

How it earns trust. Every figure carries a source, and every source carries a grade. Of the 28 sources, 16 are grade A — official government records and named implementing partners — and 11 are grade B. Exactly one is grade D: the candidate's own website. It is used for *what he has actually said*, and never as proof that something was delivered.

How much was read. 35 source documents were opened and classified: 26 became published entries, 3 were kept for background, 3 were duplicates of something already held, 2 were dropped because they were not evidence of an achievement, and 1 is queued and not yet classified. Counting the rejections matters as much as counting the entries, and so does counting what is still queued.

THE CHAIN, IN ORDER

1

Need

8 recorded needs across 7 sectors — the gap to be closed.

2

Achievement

25 records across 6 sectors and 16 of the 20 LGAs.

3

Promise

8 published commitments across 8 sectors, each with the test that would show it worked.

4

Result

8 tracked indicators whose movement decides whether any of it landed.

ONE HONEST GAP

None of the 8 commitments carries a target date, because the campaign has not published one. Each one carries a success indicator instead. The site shows the absence rather than filling it in.

WHAT IT IS

- **7 pages**, each doing one job, in English and Hausa.
- A **register of 28 sources** across 17 publishers — government, news, implementing partners, and the campaign itself.
- A **map of 212 registration areas** in all 20 LGAs, on any phone.
- Two ways to be heard: one question, and one need.

WHAT IT IS NOT

- **Not private polling.** No registered voter is contacted, and no result is a forecast of an election.
- **Not an audit.** 10 of 25 records rest on grade B evidence and most say "follow-up required".
- **Not a press office.** Criticism is recorded where a source supports it.
- The 212 registration areas are **provisional**: the list was transcribed from published sources, not downloaded as a dataset.

Seven pages. Seven questions a voter actually asks.

Every page below is linked, so this brief is also a way in: tap any figure to open the live page it came from. Two of them — the poll and the request form — are the only places a voter is heard rather than answered.

HOME · THE FRONT DOOR

Where do I start?

One screen that opens on the 8 recorded needs, the 5 featured records of work actually done, and the two ways to be heard. It is the only page a voter has to open, so it carries the argument rather than the detail — everything else on the site is a drill-down from here.

8 needs · 5 featured

Every figure on that page is one click from the document it came from. [Open the home page ↗](#)

ACHIEVEMENTS · WHAT IS DONE

What has actually been done, and can I check it?

Each record carries its evidence grade, its verification status and a link to the original. A project that was flagged off but not finished reads exactly like that — "completion not yet verified" — instead of being counted as delivered.

25 records · 6 sectors

16 of 20 LGAs, plus 2 aggregate scopes. [Read the records ↗](#)

ATLAS · THE MAP

How does my own area compare?

A tappable map of all 20 LGAs and 212 registration areas. Pick your area and read the need, the delivery and the promise for that place — not for Bauchi in general.

212 areas · 20 LGAs

[Open the map ↗](#)

AGENDA · THE COMMITMENTS

What is promised, and how would I know it happened?

8 published commitments across 8 sectors, each shown with the test that would show it worked. No target dates, because none are published.

8 commitments

[Read the agenda ↗](#)

SOURCES · THE REGISTER

Can I check any of this myself?

28 sources across 17 publishers, graded A, B or D, each one click from the original document. This is the page that makes the other six auditable.

16 grade A · 11 B · 1 D

[Open the register ↗](#)

ABOUT · THE PEOPLE

Who is behind this?

The candidate record, this contributor, and a screen recording of the live site — so the claim "it works on a phone" can be checked by watching it work rather than by being told. The recording was made on 02 October 2026, before the first response arrived, and is published in both a widescreen and a phone cut.

14 registered assets

Every image re-checked against its recorded hash on each build. [Download the recording ↗](#)

SPEAK TO US · THE ONLY TWO DOORS

What do you want, and what do you actually need?

The one page where a resident is not answered but heard: **one question** on which sector to prioritise first, and **one stated need** for the campaign to act on. The first takes no identity at all; the second deliberately asks for it, because the point is a reply. They are on the same page on purpose — the difference between them is the whole privacy argument, so it should be visible side by side rather than split across two sites.

1 question · 9 options · 0 responses so far

The next page sets both out in full. [Open the poll and the request form ↗](#)

Two doors. Neither one takes your name.

The site is mostly for reading. These are the two places where a resident can change what it says next — and both were built so that answering cannot identify the person who answered.

DOOR ONE

The poll — one question

THE QUESTION

“Which sector should APM prioritise first?” One question, 9 options, nothing else to get wrong.

WHAT IT NEEDS FROM YOU

Your area. That is the one required answer — a statewide bar would tell nobody anything.

WHAT IT NEVER ASKS

No name. No phone. No email. No address. No exact age, and the form refuses those fields by name rather than quietly dropping them.

WHAT IS OPTIONAL

Your registration area, an age band, and gender — so the answer can be broken down by area later. Age is a band, never a number.

WHAT IS PUBLISHED

Counts and shares, per area and per sector — but never a cell small enough to point at a person.

DOOR TWO

The request form — one need

WHAT IT IS FOR

Stating a need the campaign should act on. This is the opposite of the poll: here you **are** asked who you are, because the point is a reply.

WHAT IT ASKS

One need, your area, a name, a street address, and — if you want a reply — an email address.

WHAT IT REFUSES

A phone number. It was removed on purpose: this is about one need, not about building a contact list. Email is the only channel back.

WHO CAN READ IT

Campaign staff only. It is staff workflow data, and the most sensitive thing in this project.

HOW LONG IT IS KEPT

Indefinitely, by an owner decision — stated on the page rather than left to be inferred. Blanking a cell later still leaves it in the spreadsheet's own history.

Both doors are on one page: the poll at the top, the request form below it →. They share a page on purpose. The contrast between a form that takes no identity and a form that deliberately asks for it is the clearest way to show what consent means, so it should be visible side by side rather than argued in prose.

No identity on the poll

Refused by field name, not dropped behind the form.

Small cells withheld

A cell under the threshold prints as a dash, never as a zero.

Comments expire

180 days by default, 365 at the outside, deleted automatically.

Comments held apart from votes

A text cannot be matched back to a ballot.

Right now the poll has 0 responses. The bars are empty because nobody has answered yet — not because it is broken. An empty cell and a withheld cell are drawn differently on purpose: one means “nobody chose this”, the other “too few to say”.

What to watch for: once the first response lands, the dashboard must be rebuilt from the exported sheet and committed — a vote arriving does not publish itself — and the screen recording must be re-shot, because its caption says the poll is empty.

0

responses recorded
as at 02 October 2026

It is already published. A domain of its own is four steps.

The site lives on GitHub Pages, which is free and already live. If the campaign wants its own address, the address is the only thing that has to be bought — the site stays exactly as it is, because nothing about it needs a server.

HOW IT IS PUBLISHED TODAY

- 1 Data in, pages out**
Every figure on the site comes from the CSV register in `data/delivery/`. One renderer turns that into all 7 pages.
- 2 A scheduled rebuild commits the result**
A weekly job rebuilds and publishes every Monday at 06:00 UTC, and there is a button to force one by hand. No pasting into a spreadsheet, no manual upload.
- 3 The pages are the published artefact**
What a visitor receives is the rebuilt page itself, so the site cannot silently disagree with the data behind it.

TO PUT IT ON ITS OWN DOMAIN

- 1 Buy the name**
Any registrar, any extension. The price is set by the registrar and renews yearly — it is the one recurring cost this project has.
- 2 Name it in the repository**
One line, in a single file, telling the site which address it is:

```
docs/CNAME
batestguy.github.io ← replaced by your own domain
```
- 3 Point the domain at GitHub**
In the registrar, set the domain settings to *GitHub Pages*. GitHub then supplies the exact records to enter; for an apex domain they are four A records and a CNAME for `www`. Confirm them on GitHub's own pages-help page rather than from memory — they are the one detail here that can change.
- 4 Turn on HTTPS and wait**
DNS usually resolves in minutes and can take up to a day. Then tick *Enforce HTTPS*. The address redirects to `https` and the certificate is issued free.

WHERE IT LIVES NOW

LIVE ADDRESS

<https://batestguy.github.io/bauchi-voter-pulse/> →

REPOSITORY

<https://github.com/batestguy/bauchi-voter-pulse> →

COST TO PUBLISH

Free hosting. No server, no database, no upkeep beyond the repository itself.

OWNERSHIP

Whoever holds the repository account controls the site. The domain registrar and the site owner can be different people — worth settling before a name is bought, because a lapsed domain sends the site back to its free address.

The repository behind the site

What must never be published with it

- The Apps Script id, which stays in a git-ignored file and is deliberately not committed.
- The spreadsheet id, any credential, or any contact detail.
- Any image that has not been approved and hash-checked — 14 assets are, and each build re-verifies all 14.

Built 02 October 2026 from the project's own data files, so every figure above is the figure the site is showing. This is an analysis of public sources and published campaign material: not private polling, not a forecast, not an audit. Where the evidence stops, this brief says so. Contributor: Abdulkadir Ahmad (Hammayo), a dedicated member of his campaign team.
